By the time a family tells you they are leaving, the decision was made months ago.

Class 11 admissions are settled on a mark sheet, a neighbour's advice and a coaching advertisement. The school is usually the last to know.

THREE NUMBERS MOST SCHOOLS HAVE NEVER PUT TOGETHER

Of last year's Class 10 batch, how many continued into your Class 11? .....

How many Class 11 seats did you fill from other schools? .....

How many stayed empty? .....

Multiply the last number by your annual fee. Then by two years. **That is the cost of a decision you were not part of.**

65% of Tamil Nadu's Class 12 students took Science in 2025. Around one in seventy took Arts. **No school in the state can say which of those were chosen, and which were simply arrived at.**

It is rarely the weakest students who leave

The families who move after Class 10 are often the ones whose results you would have put on the banner. The revenue and the reputation leave in the same admission.

The conversation happens without you

By Class 10 the family has already decided. Class 9 is the last point at which the school is still part of the discussion rather than informed of its outcome.

WHY CLASS 9?

Classes 1–8	Class 9	Classes 10–12
Years of observations, learning patterns and experiences are built.	**The opportunity to understand the student before major decisions arrive.**	Academic pressure and future choices become more important.

BEFORE YAADHUM	WITH YAADHUM
Student understanding is built from marks, classroom observations and individual teacher experiences.	**A structured profile combining academic, cognitive, behavioural and personal dimensions.**
A student may be known as 'good at maths' or 'weak in science'.	**The school understands why the student performs the way they do.**
Strengths and learning patterns may remain unnoticed.	**Hidden strengths, development areas and possible support actions become visible.**

The Five Dimensions of Student Understanding

Schools develop a deep understanding of students through years of teaching, assessments and teacher experience. However, much of this understanding remains distributed across different people and moments. Yaadhum brings these observations together into a structured student foundation profile. **Each dimension below is read for Class 9 specifically — what it means at this stage, and what it changes before Class 10.**

01 Academic DNA

Concepts • Application • Reasoning

Not "is this student good at maths." Class 9 carries the specific foundations that Class 10 board content is built on — algebra and identities, coordinate geometry, the first trigonometry, and the point where science separates into physics, chemistry and biology strands. A gap here is invisible until the board year, because Class 9 has no external exam to expose it.

WHAT COMES OUT

"Handles single-step algebra reliably. Accuracy falls on multi-step problems — the specific form Class 10 questions take most often. Eighteen months to close it."

02 Cognitive DNA

Observation • Patterns • Problem solving

Class 9 is the last year in which memorisation still produces good marks. Class 10 tests application. Class 11 PCM demands abstraction. A student scoring 85 through recall and a student scoring 85 through reasoning look identical on a Class 9 report card and diverge violently two years later. This dimension answers where a student's marks actually come from.

WHAT COMES OUT

"Scores well on familiar problems. On unfamiliar problems using the same concept, performance drops sharply — a pattern that usually only surfaces in Class 11, when it is too late to act on."

03 Learning Behaviour

Curiosity • Persistence • Confidence

Class 9 has no board exam, so nothing external imposes a routine. Whatever habit exists now is what the student carries into Class 10. The Class 8 to 9 syllabus jump is also where many students hit their first real academic drop — how they respond to it is the signal.

WHAT COMES OUT

"Capability is not the constraint. Study concentrates in the week before a test, which will not survive a board year."

04 Interest & Exposure

Interests • Experiences • Awareness

At 13 or 14, an aspiration is provisional and should be. What matters is breadth. In this district most students can name engineering, medicine and a government job — and stop.

WHAT COMES OUT

"Names engineering. Cannot describe what an engineer does in a working day, and has never met one."

"Cohort: of 38 students, 31 named engineering or medicine. Four could name a third option."

05 Self-Awareness

Strengths • Challenges • Motivation

Three gaps, all correctable in Class 9 and all arguments by Class 10: self-perception against record, student's aim against parent's expectation, stated aim against actual understanding.

WHAT COMES OUT

"Believes she is weak in mathematics; two years of results say otherwise. Her parent expects medicine. She has not told anyone she wants something else."

What each stakeholder gains

01

Principal / Management

A cohort map going into Class 10: which students are carrying foundation gaps into the board year, how many are aiming at a group your school may not offer, and the beginnings of a record for next year's group allocation.

02

Teachers

Which misconceptions are shared across the class rather than student by student, and which three students to look at. Ten minutes, no plans to write.

03

Students

Where they stand beyond marks, their own aim taken seriously and allowed to change, one or two things to do before the next check.

04

Parents

What their child is exploring, and an early sight of what the Class 11 decision will involve, while it can still be discussed rather than settled.

Yaadhum does not replace teacher judgement. It helps schools capture, structure and use the understanding they already build every day.
